

# Rear Light Covers

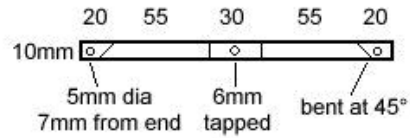

©CJH 2007 ([www.ngkitcar.co.uk](http://www.ngkitcar.co.uk))

These covers fit inside the wheel arch to protect the light fittings from the road spray. As it is not easy to find somewhere to attach the plates, a bracket is made to fit over the studs of the upper (indicator) light fitting to which the cover plate can be attached. The details of the design are shown in the diagram and photos.

Once made up, the aluminium covers can be given a coat of rubberised paint to match the underside of the wings. Also self-adhesive rubber sealing strips can be used along the edges (except for a gap at the bottom) to seal against the underside of the wing.
